This file contains information, which languages can be typeset with `ucs.sty`. It is not complete at all and shall be used as a technical reference only, i.e. you should not take it as a source of linguistic information. Names of languages and of scripts may be mixed without further notice.

If you find errors, omissions, better example strings etc., do not hesitate to contact me: <dominique@unruh.de>

1 Latin scripts

Many of the example phrases were taken from <http://hcs.harvard.edu/~igp/glass.html>.

Esperanto (Esperanto)

Esperanto can be typeset using fontencoding T1. This language is known to `babel.sty` as `esperanto`.

Examples:

Normal	<i>Eĥoĉango ĉiujaŭde</i>
Bold	<i>Eĥoĉango ĉiujaŭde</i>
Italic	<i>Eĥoĉango ĉiujaŭde</i>
Slanted	<i>Eĥoĉango ĉiujaŭde</i>
Sans serif	<i>Eĥoĉango ĉiujaŭde</i>
Typewriter	<i>Eĥoĉango ĉiujaŭde</i>

Small caps EHOŠANGO ČIUJAŬDE

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[esperanto,english]{babel}
\newcommand\esperantotext[1]{\foreignlanguage{esperanto}{#1}}
...
\esperantotext{Ehošango čiujaŭde}
```

German (Deutsch)

German can be typeset using fontencoding T1. This language is known to `babel.sty` as `german`. For Austrian use `austrian`, for new orthography: `ngerman` resp. `naustrian`.

Examples:

Normal	Häßliche Ölsardinen
Bold	Häßliche Ölsardinen
Italic	<i>Häßliche Ölsardinen</i>
Slanted	<i>Häßliche Ölsardinen</i>
Sans serif	Häßliche Ölsardinen
Typewriter	Häßliche Ölsardinen
Small caps	HÄSSLICHE ÖLSARDINEN

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[german,english]{babel}
\newcommand\germantext[1]{\foreignlanguage{german}{#1}}
...
\germantext{Häßliche Ölsardinen}
```

French (Français)

French can be typeset using fontencoding T1. This language is known to `babel.sty` as `french`.

Examples:

Normal	A sa façon
Bold	A sa façon
Italic	<i>A sa façon</i>
Slanted	<i>A sa façon</i>
Sans serif	A sa façon
Typewriter	A sa façon
Small caps	A SA FAÇON

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[french,english]{babel}
\newcommand\frenchtext[1]{\foreignlanguage{french}{#1}}
...
\frenchtext{A sa façon}
```

English

English can be typeset using fontencoding T1. This language is known to `babel.sty` as `english`. British English: `british`, American English: `american`.

Examples:

Normal	The quick brown fox jumps over the lazy dog.
Bold	The quick brown fox jumps over the lazy dog.
Italic	<i>The quick brown fox jumps over the lazy dog.</i>
Slanted	<i>The quick brown fox jumps over the lazy dog.</i>
Sans serif	The quick brown fox jumps over the lazy dog.
Typewriter	The quick brown fox jumps over the lazy dog.
Small caps	THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[english,english]{babel}
\newcommand\englishtext[1]{\foreignlanguage{english}{#1}}
...
\englishtext{The quick brown fox jumps over the lazy dog.}
```

Vietnamese (Tiếng Việt)

Vietnamese can be typeset using fontencoding T5. This language is known to `babel.sty` as `vietnam`. Note that the babel language loads `dblaccnt.sty`, which introduces potential compatibility problems.

Examples:

Normal	Sự mặc thị của Đức Chúa...
Bold	Sự mặc thị của Đức Chúa...
Italic	<i>Sự mặc thị của Đức Chúa...</i>
Slanted	<i>Sự mặc thị của Đức Chúa...</i>
Sans serif	Sự mặc thị của Đức Chúa...
Typewriter	Sự mặc thị của Đức Chúa...
Small caps	SỰ MẶC THỊ CỦA ĐỨC CHÚA...

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[vietnam,english]{babel}
\newcommand\viетnamtext[1]{\foreignlanguage{vietnam}{#1}}
...
\việtnamtext{Sự mặc thị của Đức Chúa}
```

Afrikaans

Afrikaans can be typeset using fontencoding T1. This language is known to `babel.sty` as `afrikaans`.

Examples:

Normal	Ek kan glas eet, dit maak my nie seer nie.
Bold	Ek kan glas eet, dit maak my nie seer nie.
Italic	<i>Ek kan glas eet, dit maak my nie seer nie.</i>
Slanted	<i>Ek kan glas eet, dit maak my nie seer nie.</i>
Sans serif	Ek kan glas eet, dit maak my nie seer nie.
Typewriter	Ek kan glas eet, dit maak my nie seer nie.
Small caps	EK KAN GLAS EET, DIT MAAK MY NIE SEER NIE.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[afrikaans,english]{babel}
\newcommand\afrikaanstext[1]{\foreignlanguage{afrikaans}{#1}}
...
\afrikaanstext{Ek kan glas eet, dit maak my nie seer nie.}
```

Bahasa

Bahasa can be typeset using fontencoding T1. This language is known to `babel.sty` as `bahasa`.

Brazilian

Brazilian can be typeset using fontencoding T1. This language is known to `babel.sty` as `brazil`.

Breton

Breton can be typeset using fontencoding T1. This language is known to `babel.sty` as `breton`.

Catalan (Català)

Catalan can be typeset using fontencoding T1. This language is known to `babel.sty` as `catalan`.

Examples:

Normal	Puc menjar vidre que no em fa mal.
Bold	Puc menjar vidre que no em fa mal.
Italic	<i>Puc menjar vidre que no em fa mal.</i>
Slanted	<i>Puc menjar vidre que no em fa mal.</i>
Sans serif	Puc menjar vidre que no em fa mal.
Typewriter	Puc menjar vidre que no em fa mal.
Small caps	PUC MENJAR VIDRE QUE NO EM FA MAL.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[catalan,english]{babel}
\newcommand\catalantext[1]{\foreignlanguage{catalan}{#1}}
...
\catalantext{Puc menjar vidre que no em fa mal.}
```

Croatian

Croatian can be typeset using fontencoding T1. This language is known to `babel.sty` as `croatian`.

Czech (Česky)

Czech can be typeset using fontencoding T1. This language is known to `babel.sty` as `czech`.

Examples:

Normal	Můžu jít sklo; to mi neškodí.
Bold	Můžu jít sklo; to mi neškodí.
Italic	<i>Můžu jít sklo; to mi neškodí.</i>
Slanted	<i>Můžu jít sklo; to mi neškodí.</i>
Sans serif	Můžu jít sklo; to mi neškodí.
Typewriter	Můžu jít sklo; to mi neškodí.
Small caps	MŮŽU JÍST SKLO; TO MI NEŠKODÍ.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[czech,english]{babel}
\newcommand\czechtext[1]{\foreignlanguage{czech}{#1}}
...
\czechtext{Můžu jít sklo; to mi neškodí.}
```

Danish (Dansk)

Danish can be typeset using fontencoding T1. This language is known to `babel.sty` as `danish`.

Examples:

Normal	Jeg kan spise glas, det gør ikke ondt på mig.
Bold	Jeg kan spise glas, det gør ikke ondt på mig.
Italic	<i>Jeg kan spise glas, det gør ikke ondt på mig.</i>
Slanted	<i>Jeg kan spise glas, det gør ikke ondt på mig.</i>
Sans serif	Jeg kan spise glas, det gør ikke ondt på mig.
Typewriter	Jeg kan spise glas, det gør ikke ondt på mig.
Small caps	JEG KAN SPISE GLAS, DET GØR IKKE ONDT PÅ MIG.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[danish,english]{babel}
\newcommand\danishtext[1]{\foreignlanguage{danish}{#1}}
...
\danishtext{Jeg kan spise glas, det gør ikke ondt på mig.}
```

Dutch

Dutch can be typeset using fontencoding T1. This language is known to `babel.sty` as `dutch`.

Examples:

Normal	Ik kan glas eten. Het doet geen pijn.
Bold	Ik kan glas eten. Het doet geen pijn.
Italic	<i>Ik kan glas eten. Het doet geen pijn.</i>
Slanted	<i>Ik kan glas eten. Het doet geen pijn.</i>
Sans serif	Ik kan glas eten. Het doet geen pijn.

Typewriter	Ik kan glas eten. Het doet geen pijn.
Small caps	IK KAN GLAS ETEN. HET DOET GEEN PIJN.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[dutch,english]{babel}
\newcommand\dutchtext[1]{\foreignlanguage{dutch}{#1}}
...
\dutchtext{Ik kan glas eten. Het doet geen pijn.}
```

Finnish (Suomi)

Finnish can be typeset using fontencoding T1. This language is known to `babel.sty` as `finnish`.

Examples:

Normal	Pystyn syömään lasia. Se ei koske yhtäään.
Bold	Pystyn syömään lasia. Se ei koske yhtäään.
Italic	<i>Pystyn syömään lasia. Se ei koske yhtäään.</i>
Slanted	<i>Pystyn syömään lasia. Se ei koske yhtäään.</i>
Sans serif	Pystyn syömään lasia. Se ei koske yhtäään.
Typewriter	Pystyn syömään lasia. Se ei koske yhtäään.
Small caps	PYSTYN SYÖMÄÄN LASIA. SE EI KOSKE YHTÄÄN.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[finnish,english]{babel}
\newcommand\finnishtext[1]{\foreignlanguage{finnish}{#1}}
...
\finnishtext{Pystyn syömään lasia. Se ei koske yhtäään.}
```

Estonian

Estonian can be typeset using fontencoding T1. This language is known to `babel.sty` as `estonian`.

Examples:

Normal	Ma võin klaasi süüa, see ei tee mulle midagi.
Bold	Ma võin klaasi süüa, see ei tee mulle midagi.
Italic	<i>Ma võin klaasi süüa, see ei tee mulle midagi.</i>
Slanted	<i>Ma võin klaasi süüa, see ei tee mulle midagi.</i>
Sans serif	Ma võin klaasi süüa, see ei tee mulle midagi.
Typewriter	Ma võin klaasi süüa, see ei tee mulle midagi.
Small caps	MA VÕIN KLAASI SÜÜA, SEE EI TEE MULLE MIDAGI.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[estonian,english]{babel}
\newcommand\estonian{text}[1]{\foreignlanguage{estonian}{#1}}
...
\estonian{Ma võin klaasi süüa, see ei tee mulle midagi.}
```

Icelandic

Icelandic can be typeset using fontencoding T1.

Examples:

Normal	Èg get borðað gler, það meiðir mig ekki.
Bold	Èg get borðað gler, það meiðir mig ekki.
Italic	<i>Èg get borðað gler, það meiðir mig ekki.</i>
Slanted	<i>Èg get borðað gler, það meiðir mig ekki.</i>
Sans serif	Èg get borðað gler, það meiðir mig ekki.
Typewriter	Èg get borðað gler, það meiðir mig ekki.
Small caps	ÈG GET BORDAÐ GLER, ÞAÐ MEIÐIR MIG EKKI.

Some usage example:

```
\usepackage[utf8]{inputenc}
\newcommand\icelandictext[1]{#1}

...
\icelandictext{Èg get borðað gler, það meiðir mig ekki.}
```

Galician (Galego)

Galician can be typeset using fontencoding T1. This language is known to `babel.sty` as `galician`.

Hungarian (Magyar)

Hungarian can be typeset using fontencoding T1. This language is known to `babel.sty` as `hungarian`.

Examples:

Normal	Meg tudom enni az üveget, nem árt nekem.
Bold	Meg tudom enni az üveget, nem árt nekem.
Italic	<i>Meg tudom enni az üveget, nem árt nekem.</i>
Slanted	<i>Meg tudom enni az üveget, nem árt nekem.</i>
Sans serif	Meg tudom enni az üveget, nem árt nekem.
Typewriter	Meg tudom enni az üveget, nem árt nekem.
Small caps	MEG TUDOM ENNI AZ ÜVEGET, NEM ÁRT NEKEM.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[hungarian,english]{babel}
\newcommand\hungariantext[1]{\foreignlanguage{hungarian}{#1}}

...
\hungariantext{ Meg tudom enni az üveget, nem árt nekem.}
```

Irish

Irish can be typeset using fontencoding T1. This language is known to `babel.sty` as `irish`.

Examples:

Normal	Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.
Bold	Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.
Italic	<i>Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.</i>
Slanted	<i>Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.</i>
Sans serif	Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.
Typewriter	Tá mé in ann gloine a ithe; Ní chuireann sé isteach nó amach orm.

Small caps TÁ Mé IN ANN GLOINE A ITHE; NÍ CHUIREANN SÉ ISTEACH NÓ AMACH ORM.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[irish,english]{babel}
\newcommand\irishtext[1]{\foreignlanguage{irish}{#1}}
...
\irishtext{Tá mé in ann gloine a ithe; Ní chuireann sé isteach nō amach orm.}
```

Italian (Italiano)

Italian can be typeset using fontencoding T1. This language is known to `babel.sty` as `italian`.

Examples:

Normal	Posso mangiare il vetro, non mi fa male.
Bold	Posso mangiare il vetro, non mi fa male.
Italic	<i>Posso mangiare il vetro, non mi fa male.</i>
Slanted	<i>Posso mangiare il vetro, non mi fa male.</i>
Sans serif	Posso mangiare il vetro, non mi fa male.
Typewriter	Posso mangiare il vetro, non mi fa male.
Small caps	POSZO MANGIARE IL VETRO, NON MI FA MALE.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[italian,english]{babel}
\newcommand\italiantext[1]{\foreignlanguage{italian}{#1}}
...
\italiantext{Posso mangiare il vetro, non mi fa male.}
```

Latin (Lingua latina)

Latin can be typeset using fontencoding T1.

Examples:

Normal	Vitrum edere possum; mihi non nocet.
Bold	Vitrum edere possum; mihi non nocet.
Italic	<i>Vitrum edere possum; mihi non nocet.</i>
Slanted	<i>Vitrum edere possum; mihi non nocet.</i>
Sans serif	Vitrum edere possum; mihi non nocet.
Typewriter	Vitrum edere possum; mihi non nocet.
Small caps	VITRUM EDERE POSSUM; MIHI NON NOCET.

Some usage example:

```
\usepackage[utf8]{inputenc}
\newcommand\latintext[1]{#1}
...
\latintext{Vitrum edere possum; mihi non nocet.}
```

Upper Sorbian

Upper Sorbian can be typeset using fontencoding T1. This language is known to `babel.sty` as `uppersorbian`.

Lower Sorbian

Lower Sorbian can be typeset using fontencoding T1. This language is known to `babel.sty` as `lowersorbian`.

Norwegian (Norsk)

Norwegian can be typeset using fontencoding T1. Use `nynorsk` for new orthography.

Examples:

Normal	Jeg kan spise glas. Det gjør meg ikke vondt.
Bold	Jeg kan spise glas. Det gjør meg ikke vondt.
Italic	<i>Jeg kan spise glas. Det gjør meg ikke vondt.</i>
Slanted	<i>Jeg kan spise glas. Det gjør meg ikke vondt.</i>
Sans serif	Jeg kan spise glas. Det gjør meg ikke vondt.
Typewriter	Jeg kan spise glas. Det gjør meg ikke vondt.
Small caps	JEG KAN SPISE GLAS. DET GJØR MEG IKKE VONDT.

Some usage example:

```
\usepackage[utf8]{inputenc}
\newcommand\norsktext[1]{#1}

...
\norsktext{Jeg kan spise glas. Det gjør meg ikke vondt.}
```

Polish (Polska)

Polish can be typeset using fontencoding T1. This language is known to `babel.sty` as `polish`.

Portuguese (Portuges)

Portuguese can be typeset using fontencoding T1. This language is known to `babel.sty` as `portuguese`.

Examples:

Normal	Posso comer vidro, não me fere.
Bold	Posso comer vidro, não me fere.
Italic	<i>Posso comer vidro, não me fere.</i>
Slanted	<i>Posso comer vidro, não me fere.</i>
Sans serif	Posso comer vidro, não me fere.
Typewriter	Posso comer vidro, não me fere.
Small caps	POSSE COMER VIDRO, NÃO ME FERE.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[portuguese,english]{babel}
\newcommand\portugesetext[1]{\foreignlanguage{portuguese}{#1}}

...
\portugesetext{Posso comer vidro, não me fere.}
```

Romanian

Romanian can be typeset using fontencoding T1. This language is known to `babel.sty` as `romanian`.

Examples:

Normal	Pot minca sticla. Nu ma doare.
Bold	Pot minca sticla. Nu ma doare.
Italic	<i>Pot minca sticla. Nu ma doare.</i>
Slanted	<i>Pot minca sticla. Nu ma doare.</i>
Sans serif	Pot minca sticla. Nu ma doare.
Typewriter	Pot minca sticla. Nu ma doare.

Small caps POT MINCA STICLA. NU MA DOARE.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[romanian,english]{babel}
\newcommand\romaniantext[1]{\foreignlanguage{romanian}{#1}}
...
\romaniantext{Pot minca sticla. Nu ma doare.}
```

Scottish

Scottish can be typeset using fontencoding T1. This language is known to `babel.sty` as `scottish`.

Examples:

Normal	'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.
Bold	'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.
Italic	<i>'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.</i>
Slanted	<i>'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.</i>
Sans serif	'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.
Typewriter	'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.
Small caps	'S URRAINN DHOMH GLOINNE ITHE; CHA GHOIRTICH I MI.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[scottish,english]{babel}
\newcommand\scottishtext[1]{\foreignlanguage{scottish}{#1}}
...
\scottishtext{'S urrainn dhomh gloinne ithe; cha ghoirtich i mi.}
```

Slovak (Slovensky)

Slovak can be typeset using fontencoding T1. This language is known to `babel.sty` as `slovak`.

Spanish (Español / Castellano)

Spanish can be typeset using fontencoding T1. This language is known to `babel.sty` as `spanish`.

Examples:

Normal	Puedo comer vidrio, no me hace daño.
Bold	Puedo comer vidrio, no me hace daño.
Italic	<i>Puedo comer vidrio, no me hace daño.</i>
Slanted	<i>Puedo comer vidrio, no me hace daño.</i>
Sans serif	Puedo comer vidrio, no me hace daño.
Typewriter	Puedo comer vidrio, no me hace daño.
Small caps	PUEDO COMER VIDRIO, NO ME HACE DAÑO.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[spanish,english]{babel}
\newcommand\spanishtext[1]{\foreignlanguage{spanish}{#1}}
...
\spanishtext{Puedo comer vidrio, no me hace daño.}
```

Swedish (Svenska)

Swedish can be typeset using fontencoding T1. This language is known to `babel.sty` as `swedish`.

Examples:

Normal	Jag kan äta glas, det gör inte ont.
Bold	Jag kan äta glas, det gör inte ont.
Italic	<i>Jag kan äta glas, det gör inte ont.</i>
Slanted	<i>Jag kan äta glas, det gör inte ont.</i>
Sans serif	Jag kan äta glas, det gör inte ont.
Typewriter	<code>Jag kan äta glas, det gör inte ont.</code>
Small caps	JAG KAN ÄTA GLAS, DET GÖR INTE ONT.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[swedish,english]{babel}
\newcommand\swedishtext[1]{\foreignlanguage{swedish}{#1}}
...
\swedishtext{Jag kan äta glas, det gör inte ont.}
```

Turkish (Türkçe)

Turkish can be typeset using fontencoding T1. This language is known to `babel.sty` as `turkish`.

Examples:

Normal	Cam yiyebilirim, bana birsey yapmaz.
Bold	Cam yiyebilirim, bana birsey yapmaz.
Italic	<i>Cam yiyebilirim, bana birsey yapmaz.</i>
Slanted	<i>Cam yiyebilirim, bana birsey yapmaz.</i>
Sans serif	Cam yiyebilirim, bana birsey yapmaz.
Typewriter	<code>Cam yiyebilirim, bana birsey yapmaz.</code>
Small caps	CAM YIYEBILIRIM, BANA BIRSEY YAPMAZ.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[turkish,english]{babel}
\newcommand\turkishtext[1]{\foreignlanguage{turkish}{#1}}
...
\turkishtext{Cam yiyebilirim, bana birsey yapmaz.}
```

Welsh

Welsh can be typeset using fontencoding T1. This language is known to `babel.sty` as `welsh`.

Examples:

Normal	Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.
Bold	Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.
Italic	<i>Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.</i>
Slanted	<i>Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.</i>
Sans serif	Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.
Typewriter	<code>Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.</code>
Small caps	DW I'N GALLU BWYTA GWYDR, DWY E DDIM YN GWNEUD DOLUR I MI.

Some usage example:

```
\usepackage[utf8]{inputenc}
```

```
\usepackage[welsh,english]{babel}
\newcommand\welshtext[1]{\foreignlanguage{welsh}{#1}}
...
\welshtext{Dw i'n gallu bwyta gwydr, dwy e ddim yn gwneud dolur i mi.}
```

2 Cyrillic

Many languages named here where taken from
<ftp://ftp.dante.de/tex-archive/fonts/cyrillic/lh/doc/beresta.tgz>.

Russian (Русский)

This language can be typeset using fontencoding T2A. This language is known to `babel.sty` as `russian`.

Examples:

Normal	Луна. Балкон. Она и он. Вдруг — супруг. «Подлец!» Конец.
Bold	Луна. Балкон. Она и он. Вдруг — супруг. «Подлец!» Конец.
Italic	<i>Луна. Балкон. Она и он. Вдруг — супруг. «Подлец!» Конец.</i>
Slanted	<i>Луна. Балкон. Она и он. Вдруг — супруг. «Подлец!» Конец.</i>
Sans serif	Луна. Балкон. Она и он. Вдруг — супруг. «Подлец!» Конец.
Typewriter	Луна. Балкон. Она и он. Вдруг - супруг. «Подлец!» Конец.
Small caps	ЛУНА. БАЛКОН. ОНА И ОН. ВДРУГ — СУПРУГ. «ПОДЛЕЦ!» КОНЕЦ.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[russian,english]{babel}
\newcommand\russiantext[1]{\foreignlanguage{russian}{#1}}
...
\russiantext{Луна. Балкон. Она и он. Вдруг - супруг. «Подлец!» Конец.}
```

Ukrainian

This language can be typeset using fontencoding T2A. This language is known to `babel.sty` as `ukrainian`.

Byelorussian

Byelorussian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Bulgarian

Bulgarian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Macedonian

Macedonian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Serbian

Serbian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Moldavian

Moldavian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kurdish (Cyrillic)

Kurdish (Cyrillic) can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Ossetian

Ossetian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Tadzhik

Tadzhik can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Abkhazian

Abkhazian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Abazinian

Abazinian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Adygey

Adygey can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kabardinian-Chircassian

Kabardinian-Chircassian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Ingush

Ingush can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Chechen

Chechen can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Avar

Avar can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Dargin

Dargin can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Lak

Lak can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Lezgin

Lezgin can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Tabasaran

Tabasaran can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Mansi

Mansi can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Khanty

Khanty can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Komi

Komi can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Komi-Permyak

Komi-Permyak can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Mari

Mari can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Mordvin

Mordvin can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Saam

Saam can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Udmurt

Udmurt can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Nganasan

Nganasan can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Nenets

Nenets can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Selkup

Selkup can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Chuvash

Chuvash can be typeset using the LH fonts (fontencoding T2A).

Examples:

Normal	Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.
Bold	Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.
Italic	<i>Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.</i>
Slanted	<i>Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.</i>
Sans serif	Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.
Typewriter	Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.
Small caps	Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[T2A,T1]{fontenc}
\newcommand\chuvashtext[1]{\bgroup\fontencoding{T2A}\selectfont#1\egroup}
...
\chuvashtext{Улмуçси çуркунне çеçкере кämällä—çке ун айёñче çûреье.}
```

Azerbaijani

Azerbaijani can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Gagaus

Gagaus can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Turkmen

Turkmen can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Altai

Altai can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Balkar

Balkar can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Bashkir

Bashkir can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kazakh

Kazakh can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kara-Kalpak

Kara-Kalpak can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Karachai

Karachai can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kirgiz

Kirgiz can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Crimea-Tatar

Crimea-Tatar can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kumyk

Kumyk can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Nogai

Nogai can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Tatar

Tatar can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Uzbek

Uzbek can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Uigur

Uigur can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Dolgan

Dolgan can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Tofalar

Tofalar can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Tuvanian

Tuvanian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Khakassian

Khakassian can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Shor

Shor can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Yakut

Yakut can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Buryat

Buryat can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kalmyk

Kalmyk can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Mongolian (Cyrillic)

Mongolian (Cyrillic) can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Evenki

Evenki can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Even

Even can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Nanai

Nanai can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Ulchi

Ulchi can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Dungan

Dungan can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Chukchi

Chukchi can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Koryak

Koryak can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Nivkh

Nivkh can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Aleut

Aleut can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Itelmen

Itelmen can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Eskimo

Eskimo can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Yukagir

Yukagir can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

Kettish

Kettish can be typeset using the LH fonts (try e.g. fontencodings T2A, T2B, T2C, T2D, X2, XS). See also Russian (p. 12).

3 CJK

Japanese (日本語)

This language can be typeset using the fonts supported by CJK-L^AT_EX and fontencoding C40. Activate the Unicode option `cjkjis`

Examples:

Family `song` (kanji48 font) 私は消しゴムです。

Chinese (中文)

This language can be typeset using the fonts supported by CJK-L^AT_EX and fontencoding C00. Activate the Unicode option `cjkgb5`

Examples:

Family `ming` (Arphic font) 耶穌基督的啓示...
Family `ming` (Arphic font), slanted 耶穌基督的啓示...
Family `kai` (Arphic font) 耶穌基督的啓示...
Family `kai` (Arphic font), slanted 耶穌基督的啓示...
Family `CNS` 耶穌基督的啟示...
Family `moekai` (Taiwan MOE font) 耶穌基督的啟示...
Family `moesong` (Taiwan MOE font) 耶穌基督的啟示...

Korean (한글)

This language can be typeset using the fonts supported by CJK-LATEX and fontencoding C61. Activate the Unicode option `cjkhangul`

Examples:

Family mj	예수 그리스도의 계시라 이는...
Family mj, bold	예수 그리스도의 계시라 이는...
Family dr	예수 그리스도의 계시라 이는...
Family gr	예수 그리스도의 계시라 이는...
Family gs	예수 그리스도의 계시라 이는...
Family gt	예수 그리스도의 계시라 이는...

4 Indian scripts

Thai (ภาษาไทย)

This encoding can be typeset using the fontencoding C90 and fontfamilies `nrsr` or `dbss`,¹ or using the fontencoding LTA and one of the fonts `arialuni.ttf`² or `code2000.ttf`³.

Examples:

Fontencoding LTA, Family `arial` (`arialuni.ttf`) สวัสดีครับ, สวัสดีค่ะ
Fontencoding LTA, Family `c2000` (`code2000.ttf`) สวัสดีครับ, สวัสดีค่ะ

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[LTA,T1]{fontenc}
\newcommand\thaithext[1]{\bgroup\fontencoding{LTA}\fontfamily{arial}\selectfont#1\egroup}
...
\thaithext{สวัสดีครับ, สวัสดีค่ะ}
```

Kuy

See also Thai (p. 21).

Lavna

See also Thai (p. 21).

Pali

See also Thai (p. 21).

Devanagari

This script can be written using the fontencoding LDV and the font `arialuni.ttf`⁴, but it will lack ligatures and halfforms.

¹install CJK-LATEX and ThaiLATEX to get these

Telugu (తెలుగు)

This language can be typeset using fontencoding LTL⁵ and the TeluguTeX fonts or fontencoding LTG⁶ and the font code2000.ttf⁷.

Note that with LTG superscript vowels look wrong and no ligatures are supported.

Examples:

Fontencoding LTL, normal	తెలుగు
Fontencoding LTL, bold	తెలుగు
Fontencoding LTL, slanted	తెలుగు
Fontencoding LTL, X-non-uniform (\fontseries{nx})	తెలుగు
Fontencoding LTL, Y-non-uniform (\fontseries{ny})	తెలుగు
Fontencoding LTA, Family c2000 (code2000.ttf)	తెలుగు

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[unistring]{ucsutils}
\usepackage[LTL,T1]{fontenc}
% Note: This macro does not work in moving arguments (captions etc.)
% because of the macro call \unistring{\#1}. You may use
% \SetUnicodeOption{combine}{1}\SetUnicodeOption{nocombine} instead,
% but then you may not provide whitespaces or other ASCII characters as input,
% i.e. you have to call the macro for each word separately.
\newcommand\telugutext[1]{\bgroup\fontencoding{LTL}\selectfont\unistring{\#1}\egroup}
...
\telugutext{శ్రీకావిత్తనా}
```

⁵Contributed with `ucs.sty`. Install also TeluguTeX.

⁶Contributed with `ucs.sty`.

⁷Code2000: <http://home.att.net/~jameskass/>

5 African scripts

Ge'ez

This script can be written using the fonts `gfzemenu.ttf`⁸, `jiret.ttf`⁹ or `code2000.ttf`¹⁰. Use `fontencoding LET`.

See section 7.1 for instructions on installing these fonts. The TeX names should be as follows:

```
gfzemenu.ttf  gfzemen  
jiret.ttf     jiret  
code2000.ttf  code2k
```

Examples:

```
Family gfzem (gfzemenu.ttf) ..... አማር አይታረስ ገንዘብ አይከሰስ::...  
Family jiret (jiret.ttf) ..... በ ማ ወ አ ሚ ተ ስ ስ ስ ስ ስ ስ ስ ስ ስ ስ ስ ስ ስ ...  
Family c2000 (code2000.ttf) ..... አማር አይታረስ ገንዘብ አይከሰስ::...
```

Some usage example:

```
\usepackage[utf8]{inputenc}  
\usepackage[LET,T1]{fontenc}  
\newcommand\geeztext[1]{\bgroup\fontencoding{LET}\fontfamily{gfzem}\selectfont#1\egroup}  
...  
\geeztext{\አማር አይታረስ ገንዘብ አይከሰስ}
```

¹⁰Code2000: <http://home.att.net/~jameskass/>

6 Miscellaneous languages and scripts

Greek (Ελληνικά)

Greek can be typeset using fontencoding LGR. This language is known to `babel.sty` as `greek`. Ancient (polytonic) Greek as `polutonikogreek`. Normally the CB fonts are installed by default. You can alternatively use the Kerkis fonts¹¹¹².

Examples:

Family cmr (CB fonts)	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), bold	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), italic	χαῖρε, ὥ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), slanted	χαῖρε, ὥ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), sans serif	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), typewriter	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family cmr (CB fonts), small caps	ΧΑΙΡΕ, Ω ΧΑΙΡΕ, ἘΛΕΥΘΕΡΙΑ!
Family mak (Kerkis fonts)	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family mak (Kerkis fonts), slanted	χαῖρε, ὅ χαῖρε, Ἐλευθεριά!
Family mak (Kerkis fonts), bold ¹²	χαρε, χαρε, Ελευθεριά!
Family mak (Kerkis fonts), italic ¹²	χαρε, χαρε, Ελευθεριά!
Family mak (Kerkis fonts), small caps ¹²	ΧΑΡΕ, ΧΑΡΕ, ΕΛΕΥΘΕΡΙΑ!
Family mak (Kerkis fonts), fontshape ui ¹²	χαρε, χαρε, Ελευθεριά!
Family mak (Kerkis fonts), fontshape sco ¹²	ΧΑΡΕ, ΧΑΡΕ, ΕΛΕΥΘΕΡΙΑ!
Family mak (Kerkis fonts), fontshape cal ¹²	χαρε, χαρε, Ελευθεριά!

Some usage example:

```
\usepackage[utf8]{inputenc}
\usepackage[greek,english]{babel}
\newcommand\greektext[1]{\foreignlanguage{greek}{#1}}
...
\greektext{χαῖρε, ὅ χαῖρε, Ἐλευθεριά!}
```

Hebrew

This language (also biblical, i.e. vowelified) can be typeset using fontencoding LHE¹³. There is also a babel language (`hebrew`), but at least on my system it did not work correctly.

Examples:

Normal (Jerusalem)	למה הם פשוט לא מדברים עברית
Bold (Dead Sea)	למה הם פשוט לא מדברים עברית
Italic (Old Jaffa)	למה הם פשוט לא מדברים עברית
Sans serif (Tel Aviv)	למה הם פשוט לא מדברים עברית
Family clas, normal (HClassic)	למה הם פשוט לא מדברים עברית
Family clas, slanted (HCaption)	למה הם פשוט לא מדברים עברית
Family fr (Frank Ruehl), normal	למה הם פשוט לא מדברים עברית
Family fr (Frank Ruehl), slanted	למה הם פשוט לא מדברים עברית
Family fr (Frank Ruehl), bold	למה הם פשוט לא מדברים עברית
Family shold (Shalom Old)	למה הם פשוט לא מדברים עברית

¹¹<http://iris.math.aegean.gr/software/kerkis/>

¹²Some of the Kerkis fontstyles do not support polytonic Greek, they silently drop accented characters (except those just with oxia; see the examples)

¹³Available from /language/hebrew/hebtex/macros/latext_macros/lheenc.def. Get also files lhe*.fd.

למה הם פשטו לא מדברים עברית
ננה הם מדברים ארכאיים עברית

למה הם פשוט לא מדברים עברית
למה הם פשוט לא מדברים עברית

למה הם פשוט לא מדברים בעברית
Family redis (Redis), normal
Family redis (Redis), slanted
Family redis (Redis), bold

Some usage example:

```

\usepackage[utf8]{inputenc}
\usepackage[LHE,T1]{fontenc}
% \beginR and \endR need e-LaTeX
\newcommand\hebrewtext[1]{\bgroup\fontencoding{LHE}\selectfont\beginR#1%
\endR\egroup}
...
% The file should contain the R2L text in logical order, i.e. the rightmost letter first.
\hebrewtext{למה הם פשוט לא מדברים עברית}

```

¹⁴This script can be typeset using the package `braille.sty`, available from CTAN.

Examples:

Normal	
With <code>puttinydots</code>	
With <code>8dots</code> and <code>puttinydots</code>	
With <code>mirror</code> and <code>puttinydots</code>	

Some usage example:

```
\usepackage[compact]{braille}
% With \brailleunit == 0.75ex, the braille letters will
% approximately match the other letters in size.
\newcommand\brailletext[1]{{\setlength\brailleunit{.75ex}#1}}
...
\brailletext{.:':':.:.:.:.:}
```

IPA (intə'næʃənəl fə'netik əsousi'eɪʃn)

The IPA (International Phonetic Association) alphabet can be written using the fontencoding T3. For some letters you have to load the package tipa, possibly with options extra or tone. Activate the Unicode option **tipa**.

Examples:

Family cmr	mtə'næʃənəl fə'netik əsousi'eɪʃn
Family cmr, bold	mtə'næʃənəl fə'netik əsousi'eɪʃn
Family cmr, slanted	mtə'næʃənəl fə'netik əsousi'eɪʃn
Family cmss (sans serif)	ɪntə'hæʃənəl fə'netik əsousi'eɪʃn
Family ptm (Times)	mtə'næʃənəl fə'netik əsousi'eɪʃn
Family ptm (Times), bold	mtə'næʃənəl fə'netik əsousi'eɪʃn
Family ptm (Times), slanted	mtə'næʃənəl fə'netik əsousi'eɪʃn

¹⁴ /macros/latex/contrib/supported/braille/braille.sty

Family phv (Helvetica, sans serif) Intə'næʃənəl fə'nɛtik əsousi'eɪʃn

Some usage example:

```
\usepackage[notipa]{ucs}
\usepackage[utf8]{inputenc}
\usepackage[T3,T1]{fontenc}
\newcommand\ipatext[1]{\bgroup\fontencoding{T3}\selectfont\SetUnicodeOption{tipa}#1\egroup}
...
\ipatext{Intə'næʃənəl fə'nɛtik əsousi'eɪʃn}
```

Klingon (ፊጀጀጀጀ የፊጀ / ካጀጀጀጀ)

We deal here with Klingon using the writing system often (incorrectly) attributed to Michael Okuda¹⁵. It can be typeset using fontencoding LKL and the font pIq.mf¹⁶. You have to activate the Unicode option privatecsur in order to use Klingon characters. The characters are encoded in ucs.sty according to the CSUR Registry¹⁷.

Examples:

Normal ፊጀጀጀጀ ስጀ ብጀጀጀጀ

Some usage example:

```
\usepackage[noprivatecsur]{ucs}
\usepackage[utf8]{inputenc}
\usepackage[LKL,T1]{fontenc}
\newcommand\klingontext[1]{\bgroup\fontencoding{LKL}\fontfamily{kli}\selectfont%
    \SetUnicodeOption{privatecsur}#1\egroup}
...
\klingontext{ፊጀጀጀጀ ስጀ ብጀጀጀጀ}
```

7 Technical Details

7.1 How To Install TrueType Fonts

This section describes how to use a TrueType font with LATEX. We will concentrate on fonts which are Unicode encoded.

The explanations here are valid for teTEX, but the necessary actions should be similar in other distributions.

You need the following prerequisites to use the font:

- A fontencoding supporting that font.
- The font file (*.ttf).
- A LATEX name for the font.
- A LATEX distribution which supports TrueType fonts¹⁸ and automatic generation of PK files¹⁹.

In this document, when some language section proposes some font, the fontencoding, the font file and the LATEX name are given. If you want to install some other font for some language, see below.

¹⁵<http://www.kli.org/tlh/pIqaD.html>

¹⁶Available from //fonts/okuda/pIq.mf

¹⁷ConScript Unicode Registry: <http://www.evertype.com/standards/csur/>; this registry coordinates the assignment of blocks out of the Unicode Private Use Area to constructed/artificial scripts.

¹⁸We assume that this is done via ttf2tfm and ttf2pk or some programs of equivalent configuration syntax.

¹⁹The latter is not strictly necessary, but we will not consider the additional measures to take if this is note the case.

Step 1. Put the font file somewhere into your TTF search path.²⁰ Take care to change the filename to contain only lowercase letters.

Step 2. Run

```
ttf2tfm <fontfilename> <tfmpath>/<latexname>@<subfontencoding>@
```

Here `<fontfilename>` and `<latexname>` are as described above. `<tfmpath>` is your TFM search path.²¹

`<subfontencoding>` is the name of some SFD file²², use Unicode unless mentioned otherwise.²³

Step 3. Add the line output at the end of `ttf2tfm`'s output to `ttfonts.map`. This line should be something like

```
<latexname>@<subfontencoding>@ <fontfilename>
```

If you want to install some font which contains the characters for some fontencoding, you can easily extend the fontencoding as follows (as long as it is some fontencoding for Unicode encoded TrueType fonts):

Step 1. Choose some L^AT_EX name for the font. If you have different font files in the same font family for e.g. normal, bold, italic etc. you should choose different L^AT_EX names, in most cases just use the font's filename (without `*.ttf`)

Step 2. Choose some L^AT_EX font family name for the font. This name should not have more than five letters (all lowercase), take e.g. the first five letters of the font name or some other sufficiently clear, unique and natural abbreviation.

Step 3. Create a file `<lowercase fontencoding><fontfamily>.fd` and containing

```
\ProvidesFile{<lowercase fontencoding><fontfamily>.fd}
\DeclareFontFamily{<fontencoding>}{{<fontfamily>}}
```

Take care to provide a type the fontencoding using the correct case (lowercase or normal) as told above.

Step 4. For each font file in that family add

```
\DeclareFontShape{<fontencoding>}{{<fontfamily>}}{m}{n}{{->} * <latexname><suffix>}}
```

to the file created in step 3. To find out which `<suffix>` to use, look at other font definition files for that fontencoding (i.e. some `<fontencoding>*.fd` file). While you are looking at that file anyway, you should look whether there are any other specialities which you may want to reproduce.

7.2 Direct access to Unicode fonts

7.2.1 The fontencoding LUC

There is a special fontencoding LUC which gives direct access to Unicode fonts by code position. When LUC is activated, just use `\textunicodechar{<number>}` to access code position `<number>`.

To be used with LUC, a font font must be split into subfonts named `fontXX` where XX is hexadecimal value from 00 to 16FF (formatted as `%02x` (printf-style)).

The font `fontXX` should contain the code positions U+XX00..U+XXFF.

Note that kerning and ligatures do not work with fontencoding LUC.

²⁰`kpswhich -expand-var $TTFONTS` will show this path. You may also set it in `texmf.cnf` or as an environment variable.

²¹`kpswhich -expand-var $TFMFONTS` will show this path. You may also set it in `texmf.cnf` or as an environment variable.

²²See `ttf2tfm`'s documentation. This is something else than the fontencoding.

²³You may install a font with different encodings if they have different L^AT_EX names. The encodings `Unicode` and `UnicodeT` can even coexist with the same L^AT_EX name, because all subfont names in `UnicodeT` are postfixed with `t`.

When you install TrueType fonts as described in 7.1, choose `Unicode` or `UnicodeX`²⁴ as subfont encoding. This will generate font using the above mentioned naming conventions.

7.2.2 Using input encoding utf8 to access Unicode fonts

If you have set up a font to be usable with `fontencoding LUC`²⁵, you can directly access it with the input encoding `utf8` using the following code:

```
\makeatletter
% \unichar is called by utf8. Redefine it to call \textunicodechar
\renewcommand\unichar[1]{\textunicodechar{\#1}}
% If the active fontencoding does not support direct Unicode access,
% fall back to the normal ucs.sty-mechanism
\ProvideTextCommandDefault{\textunicodechar}[1]{\uni@char{\#1}}
```

Now a Unicode character in your document will use `\textunicodechar` in all `fontencodings` with support it (e.g. `LUC`), and the normal mechanism otherwise.

Therefore you will be able to access characters not yet supported by `ucs.sty` directly using `fontencoding LUC`.

A full example using `code2000.ttf`²⁶ would be:

```
\documentclass{article}
\usepackage[utf8]{inputenc}
\usepackage[LUC,T1]{fontenc}
\makeatletter
\renewcommand\unichar[1]{\textunicodechar{\#1}}
\ProvideTextCommandDefault{\textunicodechar}[1]{\uni@char{\#1}}

\begin{document}
{
\fontfamily{c2000}\fontencoding{LUC}\selectfont
ℳℳℳℳ % U+E0A6 U+E086 U+E096 U+E085 U+E0A7
}
\end{document}
```

Note that this example would show in an editor otherwise unless `code2000.ttf`²⁷ or some similarly encoded font is used to display the source.

²⁴`UnicodeX` supports code positions greater than `U+FFFF`. It does not work with all versions of `ttf2tfm`.

²⁵See 7.2.1
